AMENDMENTS TO THE CLAIMS:

1. (Currently amended) A method of preventing counterfeiting of a smart card,
comprising:

providing a smart card with a cryptographic structure for authorizing the smart card
which cannot be accessed completely by a predetermined small number of readings,

wherein said cryptographic structure can be built only by whoever emits the
card or an agent thereof; and

providing a reader for reading said smart card and including a database holding
information related to unauthorized smart cards, said reader being on-line, such that said
reader is operatively connected to a network, only when said database of said reader is being
updated by said network,

wherein said reader includes a random number generator, which, when a card is read,
chooses a pair (a, b) of distinct numbers with $a < b$ between 1 and N.

2. (Canceled).

3. (Original) The method of claim 1, wherein an entire process of said method is
performable off-line.

4. (Original) The method of claim 1, wherein said smart card carries thereon
predetermined N channels as C1, C2,..., CN, where N is an integer,

U.S. Application No. 09/685,026
Docket No. YOR920000165US1
(YOR.203)

3

wherein each channel C_i , with i equal to 1, 2, ..., N , carries a pair of numbers (h_i , l_i),
and

wherein h_i is the i^{th} *high number* and l_i is the i^{th} *low number*.

5. (Original) The method of claim 4, further comprising:

using public key cryptography with associated encoding and decoding functions V_i
and V_i^{-1} in each channel i ,

wherein each function V_i^{-1} is known publicly, and V_i is known only to a
predetermined party representing an owner of the smart card.

6. (Original) The method of claim 5, wherein for each i in 1, 2, ..., N , the pair (h_i , l_i) is
such that $h_i = V_i(l_i)$, or $h_i = V_i(K(l_i))$, where K represents a publicly-known cryptographic
hash function, and

wherein each l_i contains a plurality of symbols for redundancy.

7. (Original) The method of claim 6, further comprising:

processing, using an invertible function f which is made public, such that the low
numbers in said smart card satisfy $l(i+j) = f^j(l_i)$, where f^j represents the j^{th} iteration of the
function f .

Docket No. YOR920000165US1
(YOR.203)

4

8. (Currently amended) The method of claim 6, ~~wherein a reader includes a random number generator, which, when a card is read, chooses a pair (a, b) of distinct numbers with $a < b$ between 1 and N,~~

wherein before processing the smart card, the reader obtains the pair (ha, la) and hb;
using the public keys Va^{-1} and Vb^{-1} , checking by the reader whether the pairs (ha, la) and (hb, lb) are compatible, and, consequently, that the numbers ha, la, and hb belong to a same legitimate card.

9. (Currently amended) The method of claim 4, wherein said [[a]] reader obtains a content of only two of said channels.

10. (Currently amended) The method of claim 1, further comprising:
periodically communicating, by said [[a]] reader of said smart card, with a data base where a predetermined characteristic of the card is checked.

11. (Original) The method of claim 10, wherein the predetermined characteristic comprises whether a smart card has delivered more than a predetermined amount of money to a user of the smart card.

12. (Original) The method of claim 11, wherein if a card is detected as delivering too much money, the data base communicates a corresponding number 11 to all readers in a network, so that smart cards carrying said corresponding number are declined.

U.S. Application No. 09/685,026
Docket No. YOR920000165US1
(YOR.203)

5

13. (Original) The method of claim 1, wherein said cryptographic structure is changed periodically.

14. (Original) The method of claim 1, wherein said smart card is invalidated after a predetermined time of usage.

15. (Original) The method of claim 8, wherein said pairs (hi, li) to be contained on the smart card are generated by:

choosing a prefix of l1 once for all transactions, or changed whenever needed,
wherein said prefix is publicly known; and

providing a sequence, such that the sequence is generated so that a same number is not chosen twice, and so that corresponding other li's are not chosen as new l1s.

16. (Original) The method of claim 15, further comprising:

concatenating the prefix and the sequence to form l1; and

choosing a function f which is invertible and is publicly known, to construct l2 = f(l1), l3 = f(l2), and so forth.

17. (Original) The method of claim 16, wherein the function f is chosen to be the identity map, in which case l1 = l2 = l3 = ... = IN.

U.S. Application No. 09/685,026
Docket No. YOR920000165US1
(YOR.203)

6

18. (Original) The method of claim 17, choosing, for a number N , N public key-private key pairs, such that a first private key $V1$ is for computing $h1 = V1(11)$, a second private key $V2$ is for computing $h2 = V2(12)$, and so on.
19. (Original) The method of claim 18, further comprising:
verifying whether the smart card is authentic; and
checking whether the smart card is not in a list of cards to be refused.
20. (Currently amended) The method of claim 1, wherein, when the smart card is read by said $[[a]]$ reader, a random generator is prompted which provides two integer numbers, a and b , which are not between 1 and N , with $a < b$.
21. (Original) The method of claim 20, wherein said numbers a , b are transmitted to the smart card which delivers two high numbers h_a , h_b , and a low number l_a in a channel a , and
wherein the pair (a, b) , together with a function f in a memory in the reader, are used to compute the low number $l_b = f^{(b-a)}(l_a)$, said memory in said reader delivering public keys Va^{-1} and Vb^{-1} .
22. (Original) The method of claim 21, wherein the public keys are used by a comparator together with the pairs (h_a, l_a) and (h_b, l_b) , to verify that the pairs are compatible with the corresponding keys, and that the pairs are from a same legitimate card.

Docket No. YOR920000165US1
(YOR.203)

7

23. (Currently amended) The method of claim 1, further comprising:

performing a final validation of the smart card by at least one of:

contacting a central data base if an entire transaction is made on-line with no penalty; and

checking with a local data base in said $[[a]]$ reader, said local database being refreshed periodically by contact between said local database and said central database.

24. (Currently amended) A method of preventing counterfeiting of a smart card, comprising:

providing a smart card such that none of confidential information and a cryptographic key for authorizing the smart card, is carried on the smart card;

reading said card by a reader such that in each reading, said reader reads only a predetermined small amount of information which makes the card unique,

wherein said reader includes a random number generator, which, when a card is read, chooses a pair (a, b) of distinct numbers with $a < b$ between 1 and N,

wherein before processing the smart card, the reader obtains the pair (ha, la) and hb;

using the public keys Va^{-1} and Vb^{-1} , checking by the reader whether the pairs (ha, la) and (hb, lb) are compatible, and, consequently, that the numbers ha, la, and hb belong to a same legitimate card.

25. (Original) The method of claim 24, wherein a transaction performed under said method comprises substantially an off-line transaction.

Docket No. YOR920000165US1
(YOR.203)

8

26. (Currently amended) A system for preventing cloning of a smart card, comprising:
a smart card such that a cryptographic structure for authorizing the smart card is not carried on the smart card; and
a reader for reading the smart card and including a database for linking to a network and being updated periodically with a list of unauthorized smart cards,
wherein said reader includes a random number generator, which, when a card is read, chooses a pair (a, b) of distinct numbers with $a < b$ between 1 and N,
wherein before processing the smart card, the reader obtains the pair (ha, la) and hb;
using the public keys Va^{-1} and Vb^{-1} , checking by the reader whether the pairs (ha, la) and (hb, lb) are compatible, and, consequently, that the numbers ha, la, and hb belong to a same legitimate card, and
wherein said cryptographic structure is kept secret by whoever emits the card or an agent thereof.

27. (Currently amended) A signal-bearing medium tangibly embodying a program of machine-readable instructions executable by a digital processing apparatus to perform a method for preventing counterfeiting and cloning of smart cards, comprising:
providing a smart card with a cryptographic structure for authorizing the smart card which cannot be accessed completely by a predetermined number of readings,
reading said card by a reader such that in each reading, said reader reads only a predetermined small amount of information which makes the card unique,

U.S. Application No. 09/685,026

(YOR.203)

9

wherein said reader includes a random number generator, which, when a card is read, chooses a pair (a, b) of distinct numbers with $a < b$ between 1 and N,

wherein before processing the smart card, the reader obtains the pair (ha, la) and hb;

using the public keys Va^{-1} and Vb^{-1} , checking by the reader whether the pairs (ha, la) and (hb, lb) are compatible, and, consequently, that the numbers ha, la, and hb belong to a same legitimate card, and

wherein said cryptographic structure can be built only by whoever emits the card or an agent thereof.

28. (Previously presented) The method of claim 1, wherein information stored on said smart card is devoid of confidential information.
